

Funding for Diabetes research 1

✖ Health charity Diabetes UK and the Chief Scientist Office of the [Scottish Government](#) have today announced joint funding of over £675,000 to establish a major resource in Scotland for research into Type 1 diabetes.

The 'Scottish Diabetes Research Network (SDRN) Type 1 Diabetes Bioresource' will see the development of an invaluable data source for researchers and will lay down the foundation for many future diabetes studies worldwide.

A key aim of the Bioresource project is to develop methods for preventing diabetes and its associated complications.

Starting in late 2010, patients will be invited to take part during their usual clinic visits. A network of diabetes specialists across Scotland will ask patients aged 16 years and over with Type 1 diabetes to donate a sample of blood and urine.

By combining samples with information on the patient's diabetes history the bioresource will enable future research into the causes and consequences of Type 1 diabetes which could lead to new avenues of research into prevention and improved treatments.

The study will initially take place at clinics in Aberdeen, Dundee, Dunfermline, Edinburgh, Glasgow, Kirkcaldy and Livingston and aims to include up to 10,000 patients, with other centres anticipated to join as the study progresses.

Study co-ordinator Professor Helen Colhoun of Dundee University, said:-“The spirit of collaboration between diabetes researchers across Scotland and the two funders has been fantastic. Most importantly, people living with diabetes

are hugely supportive of our work. This ambitious project will help us to identify and monitor new biomarkers, i.e. biological characteristics, which will be used to follow the progress and response to the treatment of patients with diabetes and to further our understanding of the causes of diabetes. All personal information will be recorded anonymously to ensure patient confidentiality.”

Health Secretary Nicola Sturgeon, said:-“We are delighted to be able to provide funding for this project which will be an invaluable research resource with the ultimate aim of improving the treatment of patients with diabetes. Scotland is uniquely placed to carry out such research and this project capitalises on recent collaborative working to make best use of patient data.”

Dr Iain Frame, [Diabetes UK](#) Director of Research, said:-“I am delighted that Diabetes UK is able to fund this project with the CSO. Although based in Scotland because of its unique electronic health record system, this project will have a huge impact over the coming years for new and ongoing research projects into Type 1 diabetes across the world. I very much look forward to working with this network of clinicians and researchers to ensure the success of this exciting venture.”

The project will also be supported by dedicated Diabetes Research Nurses provided by the Scottish Diabetes Research Network which is also funded by the Chief Scientist Office. The Network is currently establishing a Diabetes Research Register of patients with diabetes who wish to take part in research.
