

University of Edinburgh offers course on carbon capture

The University of Edinburgh is to offer an online course discussing ways of protecting the atmosphere from excess CO₂, climate change and carbon capture and storage technology.

The massive open online course or [MOOC](#) will last for five weeks and participants will learn about the technology behind carbon capture and storage in the context of climate change.

Beginning on 15 March there are still places available on this course which it is hoped will encourage further study perhaps at Masters level.

The MOOC will be taught by leading academics at the University and, on completion, there is the option to gain a Verified Certificate.
